～MOL LNG CARRIER～

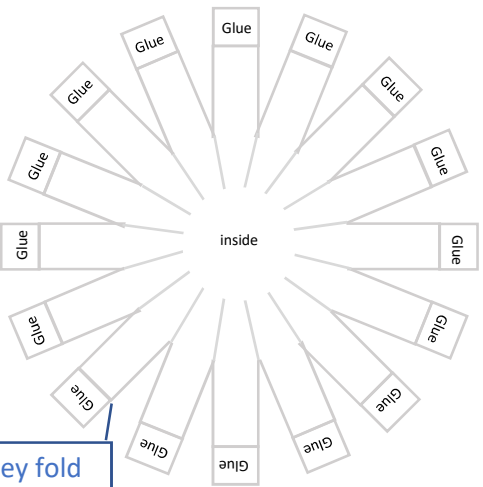

LNG stands for Liquefied Natural Gas which is a liquid formed by cooling methane, the main component of natural gas, to minus 162 degrees Celsius. Liquefaction reduces the volume of natural gas to 1/600 of that of gas, enabling a large volume of natural gas to be transported by sea at once.

LNG brought to Japan from the Middle East, Indonesia, Australia, the United States, Russia and other countries is used for thermal power generation and city gas at home, supporting our daily lives.
